

**PRIME ST (R) forms a 1  $\mu\text{m}$  thin  $\text{Fe}_2\text{O}_3$  passivation layer on the iron surface which efficiently protect the steel against corrosion**

ORMECON

**$\text{Fe}_2\text{O}_3$  layer  
(clearly detected  
and determined  
by XPS)**

**Grain  
boundaries**

**SEM picture of a steel surface treated with the **ORGANIC METAL** .  
The  $\text{Fe}_2\text{O}_3$  layer has started to grow within the grain boundaries.**

# Catalytic mechanism for the formation of the $\text{Fe}_2\text{O}_3$ layer provided by our Organic Metal

ORMECON

## • Top Coat

Passivation layer:  $\text{Fe}_2\text{O}_3$

## • Iron base material

Top coat:

- Prevents reagents from leaving Primer

Primer

- Passivation reaction site

This graph shows

- the catalytic mechanism how the OM in its conductive form "ES" is oxidizing the iron and becomes reduced to "LE".
- $\text{O}_2$  is re-oxidizing it back to ES via EB.
- The  $\text{Fe}(2+)$  is further oxidized to  $\text{Fe}(3+)$  by  $\text{O}_2$  as well, and together with the surrounding water, which is transformed to  $\text{OH}(-)$  during the oxidation reactions,  $\text{Fe}(3+)$  will form  $\text{Fe}_2\text{O}_3$ .
